Limitation of current ADHD management

Residual Symptoms

Adverse effects

## Adverse Effects

**Burdensome treatment-related side effects** can contribute to poor adherence and negatively affect quality of life <sup>5,10</sup>

95% of adults in the US receiving treatment experience at least **1 symptom related to ADHD or adverse effects** <sup>2</sup>

**2/3** of individuals will **change treatment** within 12 months <sup>2, 11, 12</sup>

**Anxiety** may show lack of improvement or potential worsening <sup>1,2, 5,13</sup>

**FDA approved non-stimulants** are associated with fatigue, insomnia, nausea, lack of appetite, constipation, dry mouth, headache, and dizziness and can lead to weight and blood pressure changes <sup>14</sup>

**Stimulants** are associated with insomnia, nausea, anxiety, mood lability, dry mouth, lack of appetite, diarrhea, and potential cardiovascular events, and some patients experience emotional blunting <sup>13-17</sup>

Adverse events commonly affect treatment adherence, including 13:

- Insomnia
- Anxiety
- Nausea
- Fatigue
- Jitteriness
- Urinary hesitation
- Constipation
- Dry mouth
- Diarrhea
- Erectile dysfunction
